#### 1.0 INTRODUCTION

This report presents the analysis results of the Central Hudson Gas and Electric Corp. ("CHGE" or the "Company") interconnection study based on the proposed interconnection and design submittal from the Interconnection Customer in accordance with the Company Interconnection Requirements for Distributed Energy Resources Connected in Parallel with the CHGE Electrical Delivery System, IEEE Standard 1547-2018 ("IEEE Standard for Interconnecting Distributed Resources with Electric Power Systems"), and "New York State Standardized Interconnection Requirements and Application Process for New Distributed Generators 5 MW or Less Connected in Parallel with Utility Distribution Systems" (NYSSIR). The intent of this report is to assess this project's feasibility, determine its impact to the existing electric power system (EPS), determine interconnection scope and installation requirements, and determine costs associated with interconnecting the Interconnection Customer's generation to the Company's Electric Power System (EPS). This Coordinated Electric System Impact Review (CESIR) study; according to the NYSSIR Section I.C Step 6; identifies the scope, schedule, and costs specific to this Interconnection Customer's installation requirements.

#### 2.0 EXECUTIVE SUMMARY

The total estimated planning grade cost of the work associated with the interconnection of the Interconnection Customer is \$284,858.45 for Option 1 and \$6,660,223.85 for Option 2.

The interconnection was found to be feasible with modifications to the existing Company EPS and operating conditions, which are described in detail in the body of this study.

#### **3.0 COMPANY EPS PARAMETERS**

Substation	Grimley Rd
Transformer Name	Transformer #2
Transformer Peak Load (kW)	1,340
Contingency Condition Load, N-1 Criteria (kW) (as applicable)	N/A
Daytime Light Load (kW)	500
Generation: Total, Connected, Queued Ahead (kW)	6,989;4,386;0
Contingency Condition Generation: Total, Connected, Queued Ahead	
(kW)	N/A
Supply Voltage (kV)	13.2
Transformer Maximum Nameplate Rating (kVA)	5000/6250
Distribution Bus Voltage Regulation	Yes
Transmission GFOV Status	Installed
Bus Tie	N/A
Number of Feeders Served from this Bus	2

Connecting Feeder/Line	3096
Peak Load on feeder (kW)	3,009
Daytime Light Load on Feeder (kW)	500
Feeder Primary Voltage at POI (kV)	13.2
Line Phasing at POI	3
Circuit distance from POI to substation	2.44 Miles
Distance from POI to nearest 3-phase (if applicable)	N/A
Line Regulation	Yes
Line/Source Grounding Configuration at POI	Effective
Other Generation: Total, Connected, Queued Ahead (kW)	2,903;386; 0

System Fault Characteristics without Interconnection Customer DG at POI with System Upgrades Described in Section 6		
	Pole K45114,	
Interconnection Customer POI Location	Weiner Road	
I 3-phase (3LLL)	1889 Amps	
I Line to Ground (310)	1874 Amps	
Z1 (100 MVA base)	1.13 + j4.19 Ohms	
Z0 (100 MVA base)	1.92 + j6.57 Ohms	

#### **4.0 INTERCONNECTION CUSTOMER SITE**

The Interconnection Customer is proposing a new primary service connection with Project No. CH-14862.

The proposed project POI is on Feeder 3096 supplied from Grimley Rd Substation Transformer #2. The POI is located approximately 2.44 miles from the substation. The POI is on three-phase 13.2 kV. The interconnection includes 1518 feet of 336 AA WR OH conductor, 120 feet of 336 AA WR OH conductor, and 1720.28 feet of 2/0 AI UG cable. The PV units are interconnected to the low side (600 V wye-Ungrounded) of the 3.42 MVA customer installed and managed pad-mounted transformer. It is necessary to extend the available 3 phase 13.2kV utility network from pole #K45114 to the new POI.

The proposed generating system consists of:

- A total of 5,408 LR5-72HBD 535M PV modules
- One SG 3425 UD-MV SUNGROW 2500 kVA solar inverters at 600 Vac output
- One, three-phase 3.42 MVA, 600 V wye 13.2 kV wye grounded, step-up transformer with 5% impedance and 4 X/R ratio

#### **5.0 SYSTEM IMPACT ANALYSIS**

The analysis was run at the rated project size in normal system configuration connected to Feeder 3096. The following table shows the impact study results of the proposed 2,500 kW system at unity power factor interconnecting to Central Hudson's distribution system.

ategory	Criteria	Limit	Result	
oltage	Overvoltage - Primary	<105% (ANSI C84.1)	Fail	
ith the additio	n of the subject generator, the maxim	um voltage as modeled on the f	eeder is	
	inal. The overvoltage will be mitigated	l by applying the mitigation men	tioned in	
ection 6.0.			ı	
oltage	Overvoltage - Project Inverters	<105% (ANSI C84.1)	Pass	
ith the additio roject inverter.	n of the subject generator, there were	e no overvoltage violations obse	rved at the	
oltage	Undervoltage	>95% (ANSI C84.1)	Pass	
ith the additio	n of the subject generator, there were	e no undervoltage violations obs	erved at the	
oltage	Substation Regulation for Reverse Power	<100% minimum load criteria	Fail	
ueue, is 6.97 M eneration to lo	sed generation on Transformer #2, inc IW. The total minimum load on this Tr ad ratio is 1394%. Reverse flow is expe Grimley Road Transformer #2 bus reg ow.	ansformer is 0.500 MW. Therefo ected through Grimley Road Sub	ore, the station	
oltage	Feeder Regulation for Reverse Power	<100% minimum load to generation ratio	Fail	
queue, is 2.9 MW. The total minimum load on this Feeder is 0.5 MW. Therefore, the generation to load ratio is 580%. There is no distribution line regulator installed between substation breaker and POI. Therefore, no mitigation for reverse power is required.  Voltage Fluctuation <a href="#">&lt;3% steady state from proposed generation on</a>				
		feeder		
	esulting voltage fluctuation at the POI ut stepping from 100% to 0%.	location is 1.83% due to the pro	posed	
oltage	Fluctuation	<5% steady state from aggregate DER on substation bus	Pass	
	esulting voltage fluctuation at the feed from $100\%$ to $0\%$ .	der location is 2.63% due to all go	eneration	
oltage	Fluctuation	Regulator tap movement exceeds 1 position, generation change of 75% of nameplate rating does not result in voltage change >½ the bandwidth of any feeder voltage regulating device.	Fail	
	load flow results show that the Griml	nar res the vol	meplate rating does not ult in voltage change >½ bandwidth of any feeder tage regulating device.	

mitigated by applying the mitigation options mentioned in Section 6.0.

Category	Criteria	Limit	Result		
Voltage	Flicker	Screen H Flicker	Pass		
E <sub>Pst</sub> = 0.350. Pst at POI = 0.119 at a generation output stepping from 100%-0%.

Protection	Fault Sensitivity	Rated capabilities of EPS equipment	Pass		
The proposed in	terconnection causes less than 10% for	ault contribution.			
Protection	Ground Fault Detection	Reduction of reach >10% (by Utility)	Pass		
The Interconnection Customer has not proposed a grounding transformer at the customer side of the interconnecting transformer.					
Protection	Overvoltage - Distribution System Fault	<125% voltage rise	Fail		
With subject ges	nerator interconnected, the modeled 6%.	voltage rise on the unfaulted pha	ases of the		
Protection	Effective Grounding	0 <r0 x1<1<br="">0<x0 td="" x1<3<=""><td>Pass</td></x0></r0>	Pass		
With subject generator interconnected, the modeled R0/X1 is 0.51286 and X0/X1 is 1.66242.					
SCADA	Required EMS Visibility for	Monitoring & Control	Yes		
	Generation Sources	Requirements			
The 2.5 MW subject generator triggers the requirement for SCADA reporting to the Utility via the use of an electronic recloser at the PCC.					
Other	Open-Phase Protection		Pass		

#### 6.0 MITIGATIONS FOR SYSTEM IMPACT ANALYSIS FAILURES

The detail below is intended to provide sufficient information and clarity to give the Interconnection Customer an understanding of the relationship of costs and scope associated with the DER interconnection and the system modifications due to the DER impact. This includes any required EPS equipment upgrades. Where scope items are identified, associated labor, equipment rentals, and indirect project support functions (such as engineering and project management) are intended and implied.

Upgrade Required	Cost Option 1	Cost Option 2	Failures Addressed
Reduce the project size for CH-14862 to 1.0 MW in total and interconnect at -98% (Consuming Vars) power factor	Customer Responsibility	N/A	Overvoltage, Tap movement
Install 600 kVAr switched capacitor bank	\$31,500	N/A	Overvoltage, Tap movement
Build a dedicated feeder for 2.44 miles	N/A	\$2,348,696	Overvoltage, Tap movement
Install a dedicated feeder regulator	N/A	\$67,330	Overvoltage, Tap movement
Upgrade Grimley Road Transformer #2 Bus Regulator control	\$95,347	\$95,347	Substation regulation for reverse power flow
Install reclose blocking	N/A	\$24,150	Unintentional Islanding
Upgrade Grimley Road Transformer #2 to 11.2/14.0 MVA @65°C	N/A	\$2,633,674	Thermal overloading
Install electric recloser at PCC	\$66,500	\$66,500	Monitoring & Control requirement
New Service	\$10,600	\$10,600	N/A

The substation upgrade required to facilitate the proposed installation for Option 1 include the following:

• Upgrading Grimley Road Transformer #2 Bus Regulator control to operate properly with the reverse power flow.

The substation upgrades required to facilitate the proposed installation for Option 2 include the following:

- Upgrading Grimley Road Transformer #2 Bus Regulator control to operate properly with the reverse power flow.
- Install reclose blocking to ensure the feeder will not close into an energized line during feeder outages when the inverters may not detect the island shut off automatically
- Upgrade Grimley Road Transformer #2 to 11.2/14.0 MVA @ 65°C
- Expand Grimley Road substation 13.8 kV Bus #2 for a new feeder breaker and install reclose block

The distribution upgrades required to facilitate the proposed installation for Option 1 include the following:

 Reduce the project size for CH-14862 to 1.0 MW in total and interconnect at -98% PF (Consuming Vars).

- A 600 kvar switched capacitor bank shall be installed at the overhead conductor closest to the substation to account for power factor impacts due to the project consuming vars.
- Install an electronic recloser at the site to enable SCADA reporting to the Utility.
- Please note that the customer will be responsible for opening a new service account at this site. Please contact Central Hudson's New Business Department for further details.

The distribution upgrades required to facilitate the proposed installation for Option 2 include the following:

- Build a dedicated feeder for 2.44 miles to interconnect the proposed 2.5 MW project.
- Install a dedicated feeder regulator
- Install an electronic recloser at the site to enable SCADA reporting to the Utility.
- Please note that the customer will be responsible for opening a new service account at this site. Please contact Central Hudson's New Business Department for further details.

In addition, as per the interconnection guidelines, the DER may not increase the ground fault current contribution at the POI by more than 10%. Project CH-14862 does not meet this requirement. Two options to mitigate the issue are listed below:

#### Option 1:

 Provide documented proof that the inverters can meet UL1741-SB fast tripping requirements per IEEE 1547-2018 Section 7.4.2 Transient Overvoltage Limits

#### Option 2:

Perform a transient analysis study to prove there is no overvoltage per IEEE 1547-2018
 Section 7.4.2 Transient Overvoltage Limits or that the inverters have fast tripping capability

This study was conducted based upon this facility being served by the interconnecting circuit during normal utility operating conditions. The terms, conditions, notification requirements, and other obligations of both the Company and the facility pertaining to disconnection of the facility are set forth in the applicable section(s) of the NYSSIR and the Interconnection Agreement that will be executed for the project(s) that were studied in this CESIR. Any change in system size and/or design is subject to the requirements of the NYSSIR, as well as supplemental documents developed by the Interconnection Technical Working Group and Interconnection Policy Working Group.

#### 7.0 CONCEPTUAL COST ESTIMATE

The following items are a good faith estimate for the scope and work required to interconnect the project estimated under rates and schedules in effect at the time of this study in accordance with the most recent version of the New York State Standardized Interconnection Requirements ("SIR").

#### Notes:

These estimated costs are based upon the results of this study and are subject to change. All costs anticipated to be incurred by the Company are listed.

The Company will reconcile actual charges upon project completion and the Interconnection Customer will be responsible for all final charges, which may be higher or lower than estimated according to the SIR I.C Step 11.

This estimate does not include the following:

- Additional interconnection study costs, or study rework
- Additional application fees
- Applicable surcharges

- Property taxes
- Future operation and maintenance costs
- Adverse field conditions such as weather and interconnection customer equipment obstructions
- Extended construction hours to minimize outage time or company's public duty to serve
- The cost of any temporary construction service
- Any required permits

Cost adders estimated for overtime would be based on 1.5 and 2 times labor rates if required for work beyond normal business hours. Per Diems are also extra costs potentially incurred for overtime labor.
